

# AWS-Lambda

Angel

# Lambda

## What is Lambda?

A serverless compute service that runs code in response to events.

## Key characteristics

- No servers to manage
- Pay only for execution time
- Event-driven
- Automatically scales

s3->SNS → SQS(queue)  
(10)(\*\*\*\*\*angeltech.csv uploaded,  
\*\*\*\*\*)→ Lambda → S3 →  
Logs(cloudwatch)

Multiple sources(5) → SQS(5) → Lambda(  
  
1. How many message in Sq  
2. If sqs = 5  
3. Trigger downstream service  
  
) → EMR CLUSTER (Airflow DAG)(ETL)

# The service that trigger the lambda functions

Amazon S3

Amazon Simple Email Service

Amazon Kinesis Data Firehose

Amazon Kinesis Data Streams

Amazon DynamoDB

Amazon SNS

Amazon SQS

AWS Config

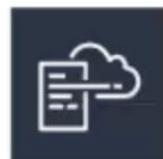

AWS IoT Button

Amazon Lex

Amazon CloudWatch

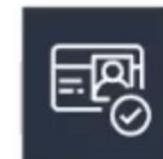

AWS CloudFormation

Amazon API Gateway

Amazon CloudFront

Amazon Cognito

AWS CodeCommit

# Cost

## How AWS Lambda charge?

- **Pay per request** Charged by number of function invocations
- **Pay per execution time** Billed by milliseconds (from start to finish)
- **Pay per memory allocation** CPU scales with memory size

## Key Cost Factors

- Invocation count
- Execution duration
- Memory configuration

## Important Notes

- No cost when Lambda is not running
- Short, fast executions are cheaper
- High-frequency triggers can become expensive

## Generous Free Tier (per month)

- 1 million requests
- 400,000 GB-seconds of compute time  
Lambda: 1GB, 1s = 1GB-second
  - i. 2GB, 3s =  $2 \times 3 = 6$ GB-second

## After Free Tier

- \$0.20 per 1 million requests
- \$0.00001667 per GB-second

1GB, 2s, 1000000

2GB-second

$2 \times 1000000 = 2000000 \times 0.00001667 = 334 \times 30 =$

A: 521mb, 10 s

# Create Lambda Function

## Step 1: Choose Creation Method

- Author from scratch
- Use a blueprint
- Container image

## Step 2: Basic Configuration

- Function name
- Runtime (Python / Node.js / Java, etc.)
- Architecture (x86\_64 or arm64)

## Step 3: Permissions

- Assign execution role
- Grant access to AWS services (S3, SQS, DynamoDB)

## Step 4: Advanced Options

- Durable execution (optional)
- Environment variables
- Timeout & memory settings

# Amazon SQS (Simple Queue Service)

## What is SQS?

- Fully managed message queue service
- Decouples producers and consumers

## Why use SQS?

- Buffer traffic spikes
- Improve system reliability
- Enable asynchronous processing

## Core Concepts

- Message
- Queue
- Producer / Consumer
- Visibility Timeout

# FIFO Queue

- First in, first out – not available in all regions
- Queue name must end with `.fifo`
- Messages are sent exactly once
- Lower throughput (up to 3000 messages/sec with batching)

# SQS – Limitations

Maximize of 120000 in flight messages being processing by consumers

Batch request has a maximum of 10 messages - max 256 kb

Message content: XML JSON or Unformatted text

FIFO queue support up to 3000 messages per second using batching

Max message size: 256 KB

Data retention: 1min - 14 days

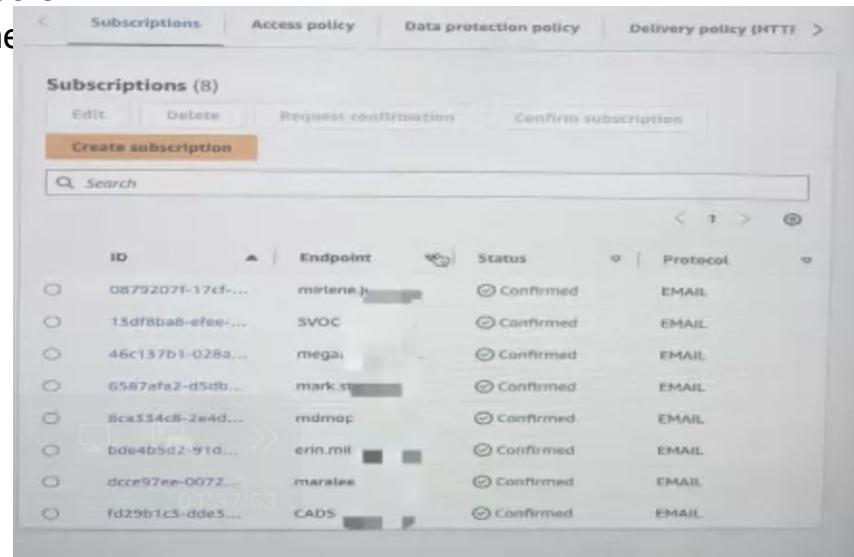

Pricing is calculated by per API request and network usage

# Amazon SNS (Simple Notification Service)

- Fully managed **publish–subscribe (pub/sub)** messaging service
- One message → **fan-out** to multiple subscribers
- Decouples message producers from consumers

## Common Subscribers

- Email / SMS
- SQS
- Lambda
- HTTP / HTTPS endpoints

The screenshot shows the 'Subscriptions' tab of the Amazon SNS console. The interface includes tabs for 'Subscriptions', 'Access policy', 'Data protection policy', and 'Delivery policy (HTTP)'. Below the tabs is a search bar and a 'Create subscription' button. The main area displays a table of 8 confirmed subscriptions:

ID	Endpoint	Status	Protocol
0879207f-17cf-...	mirlene.J...@...	Confirmed	EMAIL
15df5ba8-efee-...	SVO.C...	Confirmed	EMAIL
46c137b1-028a...	megai...	Confirmed	EMAIL
6587afa2-d5db...	mark.st...@...	Confirmed	EMAIL
8ca554c8-2e4d...	rmdmop...	Confirmed	EMAIL
bde4b5d2-91d...	erin.mil...	Confirmed	EMAIL
dcce97ee-0072...	maralee...	Confirmed	EMAIL
fd29b1c5-dde5...	CADS...	Confirmed	EMAIL

# S3 Event-Driven Architecture

S3 can emit events when objects change

Common event types:

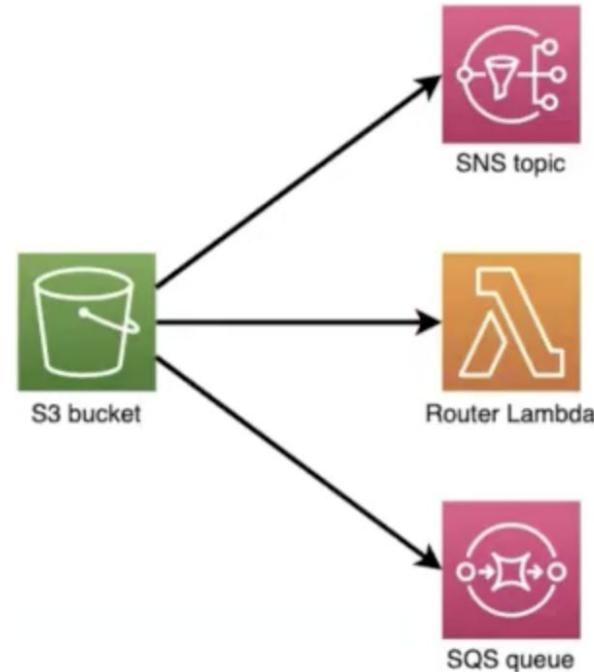

- ObjectCreated (PUT, POST, COPY, CompleteMultipartUpload)
- ObjectRemoved (DELETE)

Events can trigger downstream systems:

- AWS Lambda
- Amazon SQS
- Amazon SNS
- EventBridge

Typical use cases:

- Trigger data pipelines
- File-driven ETL
- Near real-time processing

# Cloudwatch

## What is CloudWatch?

- A **monitoring and observability service** provided by AWS
- Collects and tracks **metrics**
- Collects, stores, and searches **log files**
- Enables **alarms and automated actions**
- Provides visibility into the **health and performance** of your applications

## Typical Workflow

- AWS resources emit metrics & logs
- CloudWatch evaluates thresholds
- Alarms trigger actions (SNS, Auto Scaling, Lambda)
